AOS 100/101 Spring 2019

HOMEWORK #5 (Due Fri. April 5)

Please provide concise, grammatically correct, neatly written answers to the following questions. All questions can be answered in, at most, a few sentences. Don't forget to write your name on the paper!!!

NAME:

Two saturated parcels of air, A and B, are lifted 1 km. Parcel A has a specific humidity of 10 g kg⁻¹. Parcel B has a specific humidity of 20 g kg⁻¹. Which parcel experiences the *lesser* rate of cooling upon being lifted? Explain your answer.

(10 pts)

2) This question will involve consideration of conditions observed on two different days. On Day One, the surface temperature is 25°C and the surface dewpoint is 15°C. On Day Two, the surface temperature is 25°C and the surface dewpoint temperature is 20°C. If cumulus clouds form on both days, on which of the two days is the *cloudbase* (i.e. the height of the bottom of the cloud) lower? Clearly explain the reasoning you used to arrive at your answer.

(10 pts)

3) You and a friend head to the ocean shore from your home 20 miles inland. Before leaving you measure the temperature and dewpoint at home. Upon reaching the beach, you measure the temperature and dewpoint there as well and find that they are the same as at home. You also observe that the air is MUCH hazier at the beach. Explain why.

(10 pts)

4) On a certain day the lapse rate over Madison is measured to be 7°C/km. If dry (i.e. unsaturated) surface air has a temperature of 15°C, will it be able to rise further on its own upon being lifted to a height of 1 km (i.e. will it be *positively buoyant* at 1 km)? Clearly explain the reasoning you used to arrive at your answer.
